

Lab 8 Explanation:

- 1) Create the following design in IntelliJ IDEA's Form Design. You cannot set the properties of any component using code. All designs must be via the interface.
- 2) When the ADD to LIST button is clicked, make the coding that prints the course name you entered in the JTextField object to JList1.
- 3) When the REMOVE from LIST button is clicked, make the coding that removes and transfers the selected element in JList1 to JList2, and changes the color of JList1 to red, and the color of JList2 to green.
- 4) All components you use in coding must be the components you define in the interface. In short, copy-paste coding will not be accepted. Below is an example application.

JList App

From JList to Another JList

Math
Data Mining

OOP II
OOP I

ENTER COURSE:

ADD to LIST

REMOVE from LIST
